

Phlebo App

Phlebotomist App

Improving the efficiency of sample collection & adding features to increase revenue & AOV.

Platform	Duration	Project Involvement
Android App	Nov 2023 to Mar 2024	Design Lead

About

Whenever a customer books a lab test on Pharomeasy / Thyrocare app, A Phlebotomist (a certified technician) is assigned to collect blood samples from patient and hand it over to the lab for further processing.

Problem

- Legacy app, Confusing UX & Order Execution is poor
- Missing critical features like Order Edit, Add Beneficiary
- Sample Collection takes lot of time

Business Objective

- Modernise the UX by making it very simple & Intuitive
- Add features that help increase revenue & reduce support
- Improve order execution & slot adherence

My Role

Lead Designer, 1 PM, Engineering Lead, 2 Engineers, 1 QA

I lead the entire design for V1 of the app. It was cross collaboration with Product, Business & Operations team. Based on the discussions with operations team & also meeting few users, we created user journey's and information architecture.

Users

Phlebotomist (Phlebos)

Certified Technicians who Draws Blood from Customers, Collects Samples + Cash Payment and Dispatches to Hub for processing reports

Hub Manager

Accepts Vials (samples) from Last Mile Executives collected by Phlebos to send it to labs for processing customers reports

LME (Runner)

Collects Vials (Blood / Urine Samples) from Phlebos & Delivers to the lab.

Operations Team

These people are in charge of training, onboarding & order assignment.

Key Insights from Research

Onboarding

Onboarding happens **offline** from Operations team

Order Assignment

Order assigned by 8 pm previous day as they can get 6 am slots.

Slot Timings

Most orders come in **6 am - 10 am** slot due to fasting requirements.

App Issues

Avg. time for sample collection is **14 minutes/order**; vial scan is slow

Cancellation / Reschedule

Cancel orders without asking customer as there is **No Tracking**

Order Execution

Only **78% of orders are fulfilled** : customer unavailability, location far.

Revised Designs

The current app was very basic, slow and buggy. We Redesigned entire App & Added a bunch of features to Improve Slot Adherence, Safety measures and Order Execution.

Add Beneficiary, Upsell & Edit Order

In ~10% of the orders, Customer requests for the Order edits like changing tests & adding family members.

Scan & Punch Order

Customer escalations used to happen if vials get mixed up for multi-patient orders during sample collection

Tri-facta Calling

Phlebo's could cancel or reschedule without customers consent, which led to ~50 escalations a day. With this feature they will not be able to do it.

Outcome

Design team created prototype for each feature & shared with the phlebos. Feedback given was that design was very intuitive and easy to use.

Efficiency Gains

Reduced average time per order from **45 to 25 minutes**.

Revenue Growth

Increased Average Order Value (AOV) from ₹1,154 to ₹1,732, with **upsells** contributing **₹302 per order**.

Improve in Order Execution & Safety

Achieved 100% safety protocol adherence and **reduced cancellations** and rescheduling by over **50%**.
